Harvesting Insights: Usability Study of the ACIR Database

SI 622

Project Overview:

Purpose:

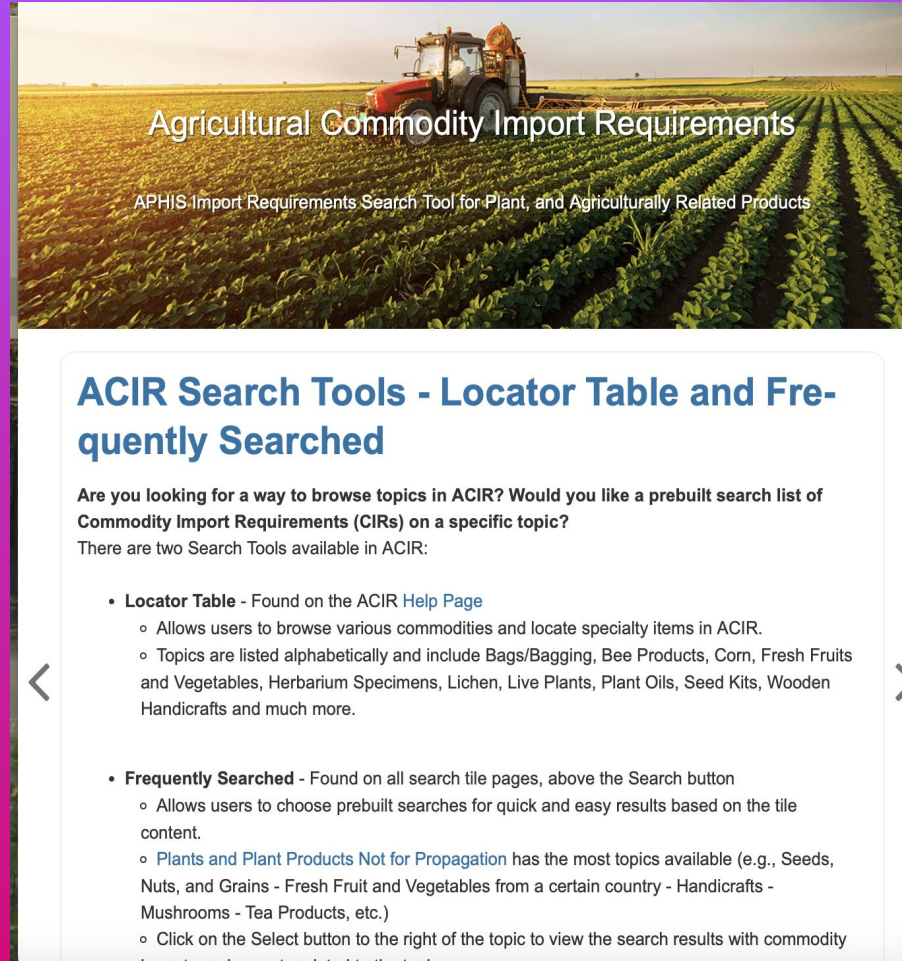

Evaluate how effectively users navigate, interpret, and apply regulatory information in the Agricultural Commodity Import Requirements (ACIR) portal.

Project Focus:

- Assess navigation, search, and filter usability
- Evaluate clarity and organization of help resources
- Examine mobile experience and small-form-factor use cases

Key Research Areas:

- Efficiency of upfront vs. post-search filtering
- User ability to locate commodity-specific requirements
- Effectiveness of current help pathways (labels, videos, guides)
- Opportunities for a centralized “single help hub”

Methods

01

Tool Used

The team utilized figma and connected with a stakeholders to discuss our analysis.

02

Process

1. Identified a primary user goal and starting point
2. Mapped key user actions and system requirements
3. Documented decision points and alternatives paths
4. Annotated in red areas of frictions, confusion, or drop-off
5. Iterated on map based on team feedback

Key Findings

1. Core Search and Organization

Users search by country-commodity combination using scientific or common names.

Search tiles are organized by “intended-use” (consumption, propagation, etc.) and product type.

Potential for a more organized and intuitive search hierarchy to ensure that users aren’t missing key elements.

2. Pre-filtering & Frequently Searched Items

Current set of pre-filters narrow search results, however, these pre-filters are limited to fresh fruits and vegetables and cut flowers.

This limited scope of pre-filters may be creating a higher cognitive load for users.

3. Mobile Layout Issues

Mobile responsiveness was not considered at all when designing the ACIR site.

Tables, layouts, and certain components do not display properly in mobile layout.

Visual inconsistencies were present between desktop and mobile versions and the current site is not responsive.
